# Power Module

- Buck regulator power module with integrated shielded inductor
- 36VDC input voltage, 4A output current
- Programmable output voltage: 1 to 7V
- Ultra-high power density: 5.0 x 5.5mm QFN footprint
- Enable, power good, soft start
- Flip-chip technology for improved thermal behavior
- UVLO, SCP, OCP, OTP

# RPX-4.0

# 4.0 Amp QFN Package

## Description

The RPX-4.0 is a buck converter with an integrated inductor in a compact 5mm x 5.5mm x 4.1mm thermally-enhanced QFN package. The input range is from 3.8 to 36VDC, allowing 5V, 12V, or 24V supply voltages to be used. The output voltage can be set with two resistors in the range from 1 up to 7VDC. The output current is up to 4A and is fully protected against continuous short-circuits, output overcurrent, or over-temperature faults, making the device particularly suitable for industrial automation, test and measurement, portable devices, and high density or weight-sensitive applications.

**OUTPUT VOLTAGE SETTING**

A resistor divider connected to the FB pin (pin 9) sets the output voltage of the RPX-4.0. The output voltage adjustment range is from 1VDC to 7VDC. The graph below shows the feedback resistor connections for setting the output voltage. The recommended value of  $R_{FB1}$  is 10k $\Omega$ . Use the equation to calculate the value for  $R_{FB2}$ . The table below lists the standard resistor values for several output voltages. The capacitance values listed represent the effective capacitance, taking into account the effects of DC  $V_{OC\_ext}$  and temperature variation.

- $V_{out\_set}$  = trimmed output voltage [VDC]
- $R_{FB1}$  = resistor (10k) [ $\Omega$ ]
- $R_{FB2}$  = calculated resistor [ $\Omega$ ]

Calculation:

$$R_{FB2} = \frac{10}{(V_{OUT} - 1)} k\Omega$$

Required Component Values		
$V_{OUTset}$ [VDC]	$R_{FB2}$ [ $\Omega$ ]	$C_{OUT}$ [ $\mu$ F]
1.0	open	150
1.1	100k	143
1.2	49k9	132
1.3	33k2	123
1.4	24k9	115
1.5	20k	107
1.8	12k4	91
2.0	10k	82
2.5	6k65	67

3.0	4k99	57
3.3	4k32	52
4.0	3k32	43
4.5	2k87	39
5.0	2k49	35
5.5	2k21	32
6.0	2k	30
6.5	1k82	28
7.0	1k65	26

**POWER GOOD OPERATING CONDITIONS**

Parameter	Condition	Min.	Typ.	Max.
PG Pull Up Voltage		0VDC		7VDC
PG Thresholds	Overshoot Undershoot		107% 92%	
PG Low Voltage	0.5mA pull-up $V_{CTRL} = 0VDC$		0.2VDC	
Minimum $+V_{IN}$ for valid PG	50 $\mu$ A pull-up $V_{CTRL} = 0VDC$ , $T_J = T_A = +25^\circ C$		2VDC	

The RPX-4.0 has a built-in power-good signal (PG) which indicates whether the output voltage is within its regulation range. The PG pin is an open-drain output that requires a pull-up resistor to a nominal voltage source of 18VDC or less. The internal 5-V LDO output (PGS pin), can be used as the pull-up voltage source. A typical pull-up resistor value is between 10k $\Omega$  and 100k $\Omega$ . The maximum recommended PG sink current is 3mA. Once the output voltage rises above 94% of the set voltage, the PG pin rises to the pull-up voltage level. The PG pin is pulled low when the output voltage drops lower than 92% or rises higher than 107% of the nominal set voltage.

**Pad Information**

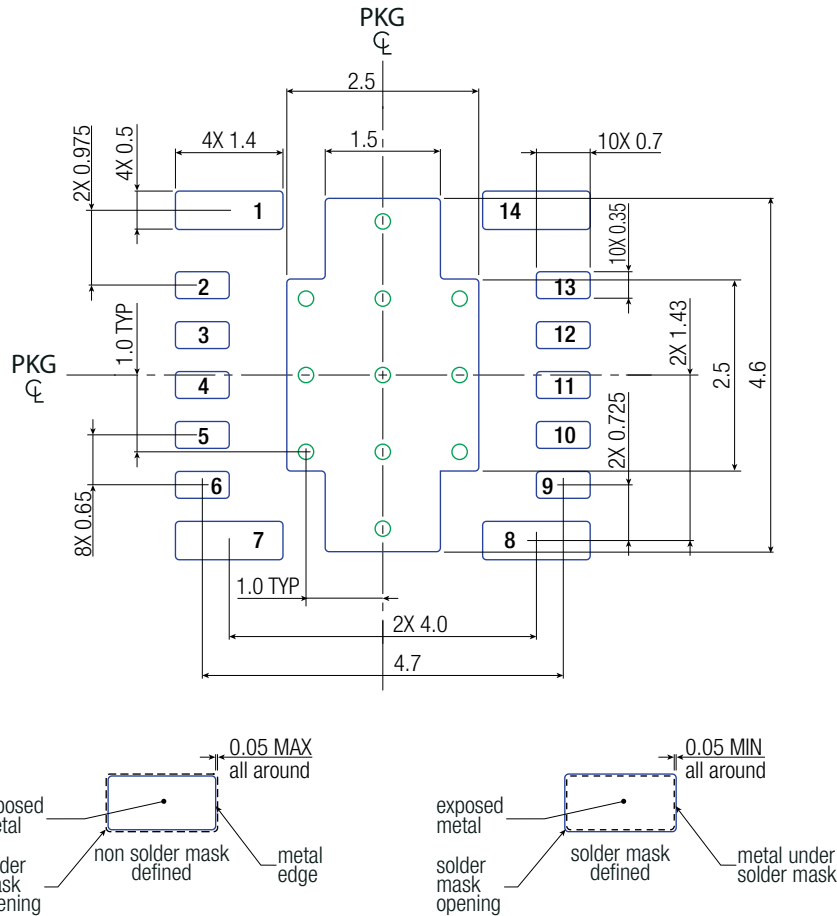

Pad #	Function	Description
12	GND	Analog ground. This pin must be connected to $-V_{IN}$ at a single point. See the layout section.
4, 5	DNC	Do not connect. Must be soldered to an isolated pad.
2	CTRL	CTRL pin. Do not float. Connected directly to $+V_{IN}$ when not used.
9	FB	Feedback input. Used to set output voltage between 1 and 7V.
3, 10, 11	NC	Not connected. Connect to $-V_{IN}$ plane for enhanced EMC and thermal performance.
15	$-V_{IN}$	System ground. Reference ground of the regulated output voltage. Connect to input supply return, load return, and input and output capacitors.
6	PG	Power good output
1, 14	$+V_{IN}$	Input supply voltage. Connect using wide PCB traces. Requires $C_{IN}$ between these pins and $-V_{IN}$ close to the pins.
7, 8	$V_{OUT}$	Output voltage. Connect external output capacitors between this pin and $-V_{IN}$ close to the pins
13	PGS	Power Good Source. Should only be used as logic supply for PG pin.

- 1 Pb-Free assembly is recommended according to JEDEC J-STD020.
- 2 Ensure that the peak re-flow temperature does not exceed 240°C as per JEDEC J-STD020
- 3 The re- flow time period during peak temperature of 240°C should not exceed 30 seconds.
- 4 Re-flow time above liquids (217°C) should not exceed 150 seconds.
- 5 For solder paste use a standard SAC Alloy such as SAC 305, type 3 or higher.
- 6 Other soldering methods (e.g. vapor phase) are not verified and have to validate by the customer on his own risk.

**PCB LAYOUT SUGGESTION**

**Layout Considerations:**

1. Large copper for power planes (+V<sub>IN</sub>, V<sub>OUT</sub>, and -V<sub>IN</sub>) for enhanced thermal performance.
2. Input and output capacitors should be placed as closely to the pins as possible.
3. Connect GND to -V<sub>IN</sub>
4. Place R<sub>FB1</sub> and R<sub>FB2</sub> as close as possible to the FB pin.
5. Use multiple vias to connect the power planes to internal layers.
